

We are fast forwarding to Task 3, previous 2 tasks are for environment setup and connectivity

Task 3
Enumeration
Welcome to Attacktive Directory

Welcome to Attacktive Directory

Welcome Dear User!

Thank you for doing my first room. I originally created this room for my final project in my Cyber Security degree program back in 2019. Since then, I've gone on to make several other rooms, even a Network for THM. In May 2021, I made the decision to renovate this room and make it more guided and less challenge based so there are more learning opportunities for others. I hope you enjoy it.

Love,

[Spooks](#)

Enumeration

Basic enumeration starts out with an **nmap scan**. Nmap is a relatively complex utility that has been refined over the years to detect what ports are open on a device, what services are running, and even detect what operating system is running. It's important to note that not all services may be detected correctly and not enumerated to it's fullest potential. Despite nmap being an overly complex utility, it cannot enumerate everything. Therefore after an initial nmap scan we'll be using other utilities to help us enumerate the services running on the device.

For more information on nmap, check out the [nmap room](#).

Notes: Flags for each user account are available for submission. You can retrieve the flags for user accounts via RDP (Note: the login format is spookysc.local\User at the Window's login prompt) and Administrator via Evil-WinRM.

Answer the questions below

What tool will allow us to enumerate port 139/445?

Correct Answer

What is the NetBIOS-Domain Name of the machine?

Correct Answer

What invalid TLD do people commonly use for their Active Directory Domain?

Correct Answer

Hint

Based on the task specifications, I've conducted enumeration using nmap.

Below are the outcomes of the enumeration process.

```
root@ip-10-10-245-243:~# nmap -sV -sS 10.10.154.248
Starting Nmap 7.60 ( https://nmap.org ) at 2024-02-26 11:24 GMT
Nmap scan report for ip-10-10-154-248.eu-west-1.compute.internal (10.10.154.248)
Host is up (0.0015s latency).
Not shown: 987 closed ports
PORT      STATE SERVICE          VERSION
53/tcp    open  domain           Microsoft DNS
80/tcp    open  http             Microsoft IIS httpd 10.0
88/tcp    open  kerberos-sec     Microsoft Windows Kerberos (server time: 2024-02-26 11:25:17Z)
135/tcp   open  msrpc            Microsoft Windows RPC
139/tcp   open  netbios-ssn     Microsoft Windows netbios-ssn

Task 4 Enumeration Enumerating Users via Kerberos

Introduction:

A whole host of other services are running, including **Kerberos**. Kerberos is a key authentication service within Active Directory. With this port open, we can use a tool called **Kerbrute** (by Ronnie Flathers @ropnop) to brute force discovery of users, passwords and even password spray!

Note: Several users have informed me that the latest version of Kerbrute does not contain the UserEnum flag in Kerbrute, if that is the case with the version you have selected, try a older version!

Enumeration:

For this box, a modified **User List** and **Password List** will be used to cut down on time of enumeration of users and password hash cracking. It is **NOT** recommended to brute force credentials due to account lockout policies that we cannot enumerate on the domain controller.

Answer the questions below

What command within Kerbrute will allow us to enumerate valid usernames?

Correct Answer

 Hint

What notable account is discovered? (These should jump out at you)

Correct Answer

What is the other notable account is discovered? (These should jump out at you)

Correct Answer

```
root@ip-10-10-57-230: ~

```

We've proceeded with Kerbrute and were supplied with a list of usernames and passwords.

```
.\kerbrute_linux_amd_64 userenum -d spookeysec.local -dc 10.10.154.248 userlist.txt
```

Introduction

After the enumeration of user accounts is finished, we can attempt to abuse a feature within Kerberos with an attack method called **ASREPROASTING**. ASREproasting occurs when a user account has the privilege "Does not require Pre-Authentication" set. This means that the account **does not** need to provide valid identification before requesting a Kerberos Ticket on the specified user account.

Retrieving Kerberos Tickets

[Impacket](#) has a tool called "GetNPUsers.py" (located in `impacket/examples/GetNPUsers.py`) that will allow us to query ASReproastable accounts from the Key Distribution Center. The only thing that's necessary to query accounts is a valid set of usernames which we enumerated previously via Kerbrute.

Remember: Impacket may also need you to use a python version ≥ 3.7 . In the AttackBox you can do this by running your command with `python3.9 /opt/impacket/examples/GetNPUsers.py`

Answer the questions below

We have two user accounts that we could potentially query a ticket from. Which user account can you query a ticket from with no password?

Correct Answer

Looking at the Hashcat Examples Wiki page, what type of Kerberos hash did we retrieve from the KDC? (Specify the full name)

Correct Answer

 Hint

What mode is the hash?

Correct Answer

Now crack the hash with the modified password list provided, what is the user accounts password?

Correct Answer

```
python3.9 /opt/impacket/examples/GetNPUsers.py spookysec.local/ -dc-ip 10.10.201.57 -
userslist valid.txt
```

This command utilizes Python 3.9 to execute the GetNPUsers.py script from the Impacket examples directory.

It retrieves hashes from the spookysec.local domain controller with the specified IP address - dc-ip 10.10.201.57,

using a list of valid usernames provided in the file valid.txt.

Enumeration:

With a user's account credentials we now have significantly more access within the domain. We can now attempt to enumerate any shares that the domain controller may be giving out.

Answer the questions below

What utility can we use to map remote SMB shares?

Correct AnswerHint

Which option will list shares?

Correct AnswerHint

How many remote shares is the server listing?

Correct Answer

There is one particular share that we have access to that contains a text file. Which share is it?

Correct Answer

What is the content of the file?

Correct AnswerHint

Decoding the contents of the file, what is the full contents?

Correct Answer

```

Let's Sync Up!

Now that we have new user account credentials, we may have more privileges on the system than before. The username of the account "backup" gets us thinking. What is this the backup account to?

Well, it is the backup account for the Domain Controller. This account has a unique permission that allows all Active Directory changes to be synced with this user account. This includes password hashes

Knowing this, we can use another tool within Impacket called "secretsdump.py". This will allow us to retrieve all of the password hashes that this user account (that is synced with the domain controller) has to offer. Exploiting this, we will effectively have full control over the AD Domain.

```
root@ip-10-10-150-185:~# python3.9 /opt/impacket/examples/secretsdump.py spookysec.local/backup:'backup2517860'@10.10.127.155 -just-dc
